Sales Performance Analysis Using Power BI

Practical Work No. 03

This report aims to analyze the sales data of the Online Retail II dataset, covering the period from 2009 to 2011, using Power BI.

The total revenue reached £25.1 million, generated from 54,000 invoices and involving 6,000 customers, with an average invoice value of £23.23.

The United Kingdom accounted for the largest share of revenue, significantly outperforming the other European countries.

The time-series chart revealed a clear seasonal pattern, with sales reaching their peak during the last months of each year (October and November), reflecting increased demand ahead of the holiday season. In contrast, sales declined at the beginning of each year.

Furthermore, the product REGENCY CAKESTAND 3 TIER ranked first among the ten best-selling products.

Interactive filters allow users to explore these trends in greater detail. Overall, the analysis highlights the company's strong dependence on the domestic market, while also revealing potential growth opportunities in other European markets.
